

Safety intelligence for real life.

A conversational, community-powered platform that helps people report, respond, remember, and recover with more clarity.

ACT NOW

One calm interface for SOS, incident reporting, nearby help, and trusted response.

STAY CONNECTED

Real-time Safety Network coordination with existing in-app voice infrastructure.

KEEP LIFE MOVING

Private Health Reminders for appointments, medication routines, and follow-ups.

Built mobile-first for Uganda. Designed to reduce cognitive load when the moment matters.

When something goes wrong, the next step is rarely obvious.

People need more than a list of emergency numbers. They need a steady layer that turns uncertainty into an actionable path, without pretending to replace human judgment or official services.

FRAGMENTED MOMENTS

Reports, calls, location, contacts, and follow-ups often live in separate tools.

HIGH COGNITIVE LOAD

Stress makes complex forms, unclear statuses, and repeated decisions harder to use.

LOW TRUST

People need to know what is happening, who sees their data, and what happens next.

The product insight

ALLMA is not a feature showcase. It is a coordination layer: conversational when users need guidance, structured when systems need reliable records, and transparent about what is real.

One assistant. Many moments of safety.

The experience begins with conversation, then moves naturally into the right workflow: a report, a call, a map, a reminder, or a verified community signal.

CONVERSATIONAL AI

Natural-language guidance for crime, missing persons, lost & found, nearby facilities, and safety questions.

EMERGENCY SOS

Immediate emergency creation, location state, Safety Network escalation, real response status, and in-app voice.

COMMUNITY RESPONSE

Opt-in responder workflows with authorization, availability, approximate distance, and auditable status changes.

HEALTH REMINDERS

Private appointment, medication, routine, and follow-up reminders with recurrence and explicit notification controls.

PUBLIC LOST & FOUND

Search property handed in to police, submit safe claims, and post lost items for officer matching.

POLICE WORKSPACE

Verified officers review incidents, missing persons, responder activity, claims, and institutional workflows.

A control screen, not a dashboard.

Manual SOS creates the real emergency immediately. The interface then answers five questions at a glance: what is happening, who is being contacted, whether location is shared, whether voice is connected, and how to stop or continue.

SOS ACTIVE	LOCATION	RESPONDERS	VOICE
Emergency created immediately	Shared, approximate, or unavailable	Authorized contacts, real statuses	ZEGOCLOUD state, never simulated

- Real emergency state is created before location or AI analysis completes.
- Responder states come from actual call and assignment records.
- Location permission never blocks SOS activation.
- A responder can confirm a welfare check; in-app reminders stop only after durable confirmation.
- Emergency calls and ordinary reminder calls remain separate systems.

A private rhythm for the care people already manage.

Health Reminders is optional, calm, and supportive. It does not diagnose, provide medical advice, or make health disclosure part of account creation.

CREATE	CONTROL	DELIVER	REVIEW
Doctor visits, hospital appointments, follow-ups, medication schedules, routine checks, or other reminders.	Optional health context, recurring schedules, app notifications, Do Not Disturb, explicit phone-call opt-in.	Due reminders are claimed atomically and delivered by backend scheduler, even when the app is closed.	Complete, reschedule, remove, and revisit reminder history. Missed appointments get a gentle follow-up.

Privacy by design

Health data is stored in its own private model, protected by row-level ownership policies, and excluded from SOS, Safety Network, community responder, and advertising paths.

A safer bridge between people and police property desks.

Anyone can search found property without signing in, submit a claim for officer review, or post something lost so it can be matched. Public summaries reveal enough to recognise an item, never enough to manufacture a claim.

SEARCH

Free-text search, district filter, and category chips for phones, bags, documents, wallets, keys, and other property.

CLAIM SAFELY

Masked identifiers, coarse areas, and proof-of-ownership text keep claims meaningful and private.

POLICE REVIEW

Verified officers see contact details, proof, pending claims, and public lost reports in the command workspace.

The trust rule

No demo claims are approved. No public user can read another claimant's contact information. Approval is an officer action, recorded with an audit event, and releases the item only after review.

Human systems, clear boundaries.

ALLMA uses AI to assist understanding, not to invent certainty. It uses automation to keep a process moving, not to hide decisions.

- Supabase-backed records with row-level security and explicit ownership boundaries.
- Verified-officer policies for police-side review and public-facing safe summaries.
- Authorized Safety Network matching, consent-aware location sharing, and real call state.
- ZEGOCLOUD remains the in-app emergency voice layer; ordinary reminder calls are separate.
- Backend scheduling uses atomic due-claiming to prevent duplicate reminder delivery.
- Honest states for unavailable location, weak connection, no answer, and failed delivery.

AI ASSISTS

Classifies, guides, and summarises with cautious language.

PEOPLE DECIDE

Users, responders, and verified officers retain the meaningful actions.

SYSTEMS RECORD

Events, statuses, claims, and outcomes remain auditable.

A working foundation, ready for responsible scale.

The current project is implemented as a mobile-first TanStack Start application with Supabase persistence and focused workflow surfaces.

IMPLEMENTED NOW	NEXT HARDENING
● Conversational safety assistant ● SOS activation and live response UI ● Safety Network and responder workflows ● ZEGOCLOUD in-app voice integration ● Private Health Reminders with scheduler ● Public Lost & Found and officer review ● Responsive dark/light UI and accessibility foundations	● Production notification provider configuration ● Operational monitoring and delivery analytics ● Expanded officer matching tools ● Native mobile background delivery ● Pilot measurement with communities and police partners

No traction, coverage, or response-time figures are claimed here until they are measured in the field.

From useful product to trusted civic infrastructure.

The roadmap grows capability without weakening the core promise: calm interfaces, real status, privacy by default, and systems that tell the truth.

PILOT	RELIABILITY	NETWORK	INTELLIGENCE
Validate SOS and responder flows with a small set of communities; measure answer rates, completion, false alarm and user comprehension.	Harden push, scheduler, reconnection, background behavior, and operational alerting across supported platforms.	Expand verified partners, facilities, police property workflows, and responder coverage with explicit governance.	Use aggregate, privacy-preserving signals to improve routing and guidance without profiling people or inferring health.

THE ASK

Help us make safety more understandable.

ALLMA is ready for the next step: responsible pilots, trusted institutional partners, and the operational support required to turn a strong product foundation into dependable public infrastructure.

PARTNER

Community organisations, police property desks, health facilities, and responders.

PILOT

Test the workflows with real people, real constraints, and measurable outcomes.

BUILD

Support reliability, safety operations, and platform expansion.
